2 2 - Vehicle Creation/ association to worksite 4

1 1 - Worksite creation

Can only be done in "dashboard app" when logged in as a company manager - hence Arcure cannot do it for the customer

The following video shows how to create a worksite:

The screenshot shows the 'Create a site' form in the SLA-TAIR dashboard app. The form is titled 'Create a site' and has a 'Go to events' link. It contains several input fields: 'Default date' (with a calendar icon), 'All events' (a dropdown menu), 'All of vehicles' (a dropdown menu), 'Categorized events' (a dropdown menu), 'Operations hours' (a dropdown menu), 'Picture' (with a camera icon), 'Name' (a text input field), 'Site manager' (a dropdown menu), and 'Standard user' (a dropdown menu). At the bottom of the form, there are two buttons: 'Reset' and 'Create' (highlighted in yellow). The left sidebar shows navigation options like 'Add management', 'New Performance', 'Products', and 'Information'. The right sidebar shows a 'No event found' message.

The form includes the following fields:

- **worksite Name:** Enter the name of the worksite. This field is required
- **Address:** Provide the address of the worksite
- **Picture or avatar** (default picture): This can be changed if necessary and should be a picture of the worksite
- **site manager:** Optional. You can list the site manager(s) of the worksite here.
- **Standard user:** Optional - possible to list here the standard user(s) for this site (persons who will have access to information of related to the vehicles of this site)

Repeat this process to create additional worksites.

2 2 - Vehicle Creation/ association to worksite

A vehicle can be created either when registering a product (see [How to register a product](#)) or from the page of a Vehicles.

The following video shows how to create a vehicle

The video below starts from the product page of the dashboard app and shows how to create a new vehicle.

The editing form includes the following fields:

- **Functionality selector:** This field allows you to select whether the vehicle will be used for the checklist, the dashboard, or both. The display of other fields depends on the choice made here.
- **Picture or avatar:** Optional. This allows you to choose an image for your vehicle.
- **Name:** Required. This field enables you to specify the vehicle's name.
- **Worksite:** Required. This field is used to assign the vehicle to a specific worksite.
- **Category:** Required. This field allows you to specify the vehicle's category. Choose from the provided dropdown list.
- **Brand:** Optional. This allows you to define the brand of your vehicle.
- **Model:** This field is optional and it allows you to specify the model of your vehicle.

Vehicle association to a worksite:

When adding a new vehicle, you must specify the worksite it will be associated with. If the worksite doesn't exist yet, you'll need to create it beforehand. Afterward, you can link your vehicle to your PU. This operation is mandatory, otherwise the data of the PU/ vehicle won't be visible in the dashboard.

After this stage, the vehicle is linked to a workiste but has no product / PU attached. To add a product to the vehicle in this particular case, see 2nd part of chapter "2.2 - Registration through Dashboard App (by customer only)" in article [How to register a product](#)

Once a vehicle with a registered system is linked to a worksite, the different data (KPIs, events, etc.) can be visualized in the different pages of the dashboard.
